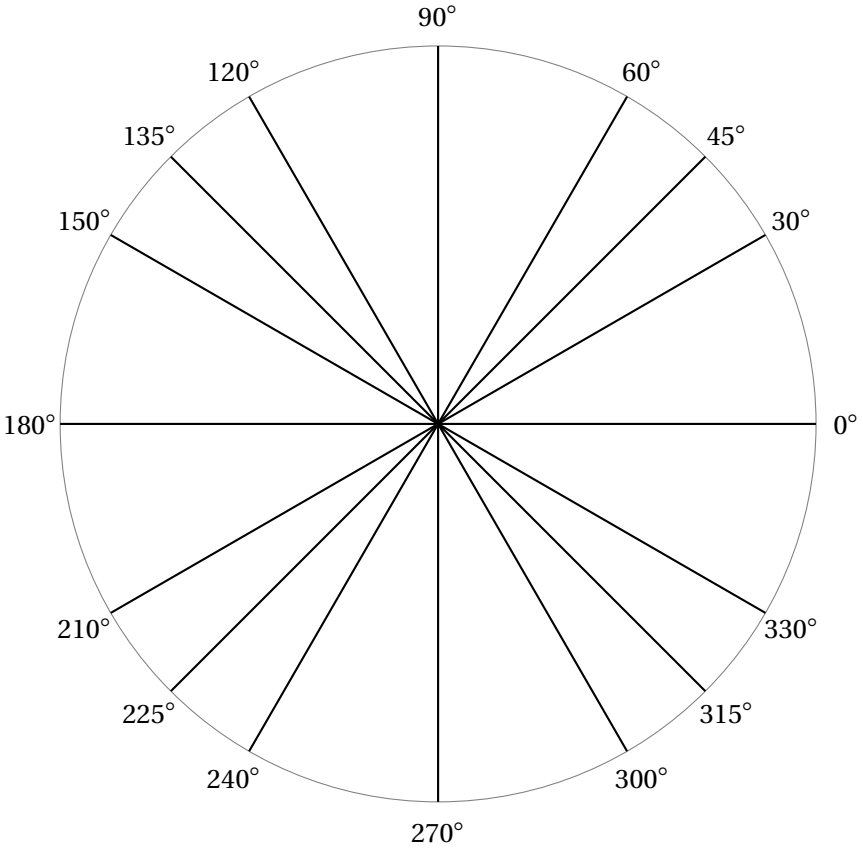
Section 3.1/3.2

The Radian Measure and Arclength

1. State the radian measure of all multiples of 30° and 45° going around a circle using the notion of these angles as a fraction of a full circle.



Converting Between Measures

2. Convert $108°$ to radians.

3. Convert $-457.89°$ to radians.

4. Convert $\frac{11\pi}{12}$ to degrees.

5. Convert $-\frac{7\pi}{6}$ to degrees.

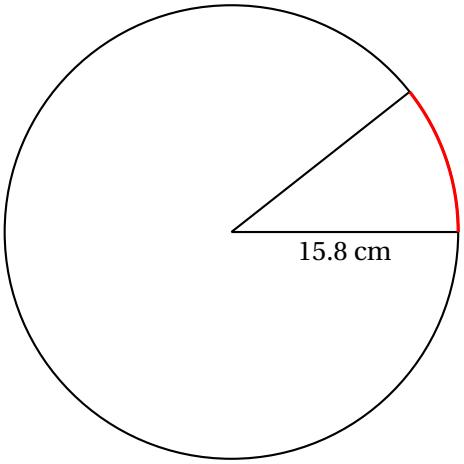
6. Convert 15.292 to degrees.

7. Find the value of $\cos\left(\frac{5\pi}{6}\right)$.

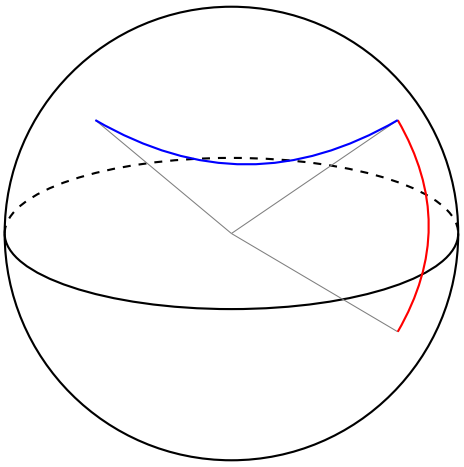
8. Find the value of $\sin\left(\frac{\pi}{4}\right)$.

9. Find the value of $\cot\left(-\frac{2\pi}{3}\right)$.

10. Find the arc length intercepted by a central angle of 38.2° in a circle of radius 15.8 cm.



11. Suppose that city A has a latitude of 38°N and city B, which is due south, has a latitude of 15°S, what is the distance between the cities given that the radius of the Earth is 3959 mi? Could you answer the same question, but for a city C that is measured 38° west of city A?



12. A small gear of radius 3.6 inches drives a larger gear of radius 5.4 inches. Find the angle the larger gear rotates if the smaller drive gear rotates 150°.
